

Welcome to the Human Side of Tech

Communication Intelligence

The use of collaboration tools to communicate, whether for personal or business purposes, is higher than ever before. **Communication Intelligence**, our proprietary mobile and chat data processing tool alleviates the challenging, inefficient, and error-prone method of reviewing thousands of interspersed text conversations.

Communication Intelligence groups messages together based on underlying periods of activity between individuals. The resulting conversation documents are rendered in user friendly "chat bubble" style with emoji and image thumbnails, allowing reviewers to zero in on relevant content without losing context.

It works with virtually any data source and is capable of processing data from any device type, chat application or forensic software. It's powerful processing engine provides comprehensive across-device threading and de-duplication, even in the face of inconsistent contact names and network time stamps. **Communication Intelligence** has been battle tested on a large number of matters and has delivered consistent performance every time.

The smart way to review text, chat, and social media data.

Easy-to-Read Format

Increase review efficiency by formatting text, social media or mobile app chat in conversational format.

Keep Related Content Together

Maintain families with embedded pictures and video to obtain a complete picture.

Eliminate Duplicates

Reduce volume with deduplication of messages across devices.

Navigate Lengthy Conversations

Configurable settings define the start and end of conversations.

Thread Messages Across Devices

Apply Analytics to Help Resolve Questions

Answer key questions with the advanced data visualisation, social network analysis, text analytics and supervised machine learning features of popular e-discovery tools.
